

The WHEAT SITUATION

FOR RELEASE
APR. 26, P. M.
1957

WS - 153

FILE COPY
Do Not Remove

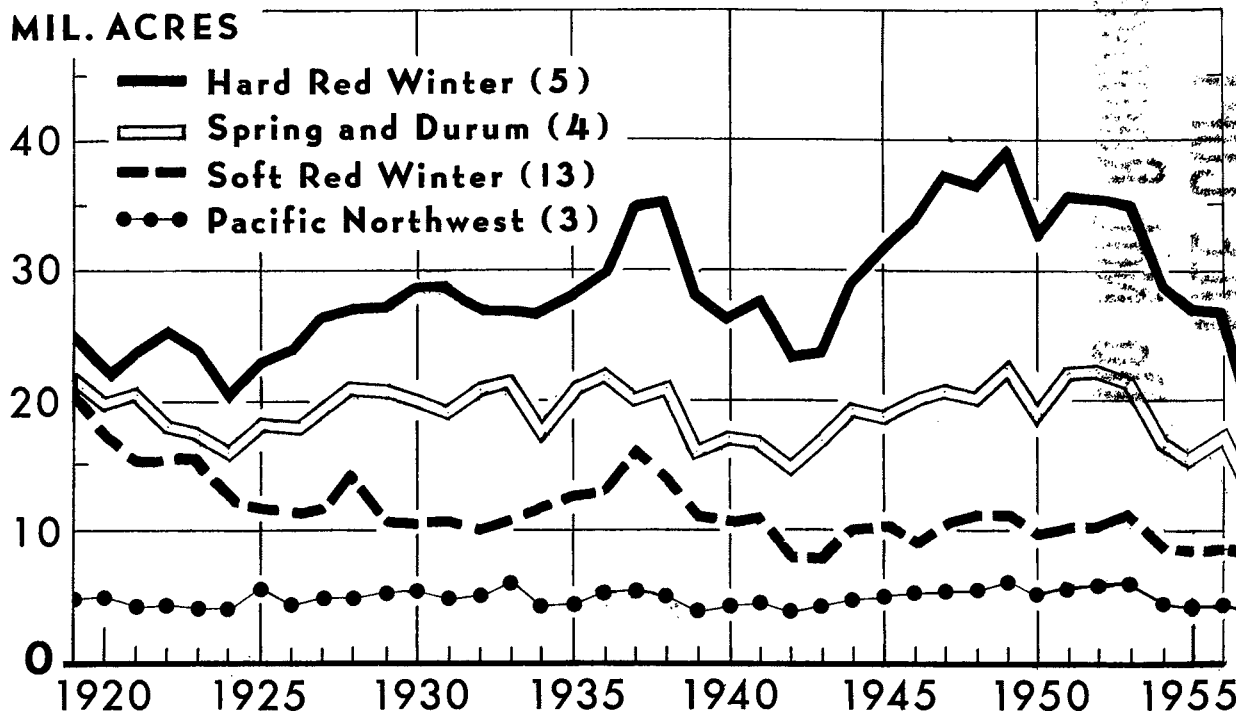

About 50 million acres of all wheat are reported seeded or to be seeded for the 1957 crop. This is 10.7 million below the 60.7 million acres seeded for the 1956 crop. The reduction results from drought conditions at seeding time and the operation of the Soil Bank Acreage Reserve Program.

The winter wheat crop was forecast at 669 million bushels as of April 1. The

first estimate of spring wheat production will be made June 10. If some increase over intentions is assumed for durum as a result of recent legislation, average yields would produce a total spring wheat crop of about 190 million bushels. This would indicate a total production of around 860 million bushels. A crop of this size would be 14 percent below 1956 and 24 percent below the 1946-55 average.

DATA FOR 1956 AND 1957 ARE PRELIMINARY

U. S. DEPARTMENT OF AGRICULTURE

NEG. 651-57 (4) AGRICULTURAL MARKETING SERVICE

Seeded acreages for harvest in 1957 are down from those a year earlier in the various regions as follows: Hard red winter, 27 percent; spring and durum, 17 percent; in the Pacific Northwest, 16 percent and soft red winter, 1 percent. Compared with the 1937-41 prewar acreage, the various regions were down as follows: Hard red winter,

36 percent; soft red winter, 31 percent; spring and durum, 23 percent and in the Pacific Northwest, 10 percent.

The estimate of current acreage is based on preliminary figures for the winter crop and farmers' intentions for the spring crop.

SUMMARY

Substantial reductions in the carryover of wheat are likely both in the current marketing year and in 1957-58. These reductions are resulting from the large U. S. exports in 1956-57 and the prospective decline in 1957 production. The carryover had risen to the very high level of over 1,030 million bushels in 1955 and 1956 from 256 million in 1952.

The carryover July 1, 1957 is now expected to be about 75 million bushels below the 1,033 million last July. The CCC may own or control all but around 100 million, which compares with 54 million bushels of "free" wheat a year earlier and 32 million bushels 2 years earlier. Larger supplies of "free" wheat are now needed by the private trade, which has taken over a larger share of the export business under the new export program.

Total supplies of wheat for 1956-57 are indicated at 2,035 million bushels, consisting of the carryover on July 1, 1956, the crop and imports. Domestic disappearance is estimated at about 600 million bushels. Exports totaled 385 million bushels July through March, compared with 215 million in the same period a year earlier. They are now expected to reach 475 million bushels for the 12 months ending June 30, 1957, compared with 346 million last year. On this basis, total disappearance would be 1,075 million bushels, and a carryover of about 960 million bushels would be on hand July 1, 1957.

The winter wheat crop to be harvested in 1957 was forecast at 669 million bushels as of April 1. The first estimate of spring wheat production will be made June 10. If some increase in acreage over intentions is assumed for durum as a result of recent legislation, about average yields would produce a total spring wheat crop of about 190 million bushels. Adding the 669 million-bushel winter crop, total production would amount to about 860 million bushels. Imports are likely to be about the same as the 5 million estimated for 1956-57.

With total disappearance of possibly 950 million bushels, consisting of 600 million for domestic use and possible exports of 350 million, a further reduction of around 85 million bushels in the carryover would occur at the end of the 1957-58 marketing year.

Cash wheat prices on April 22 ranged from about 5 cents below the high for the season to date for hard red winter at Kansas City, 10 cents below for hard red spring at Minneapolis, to about 22 cents below for soft red winter at St. Louis. The price of soft white at Portland, however, was about at the high for the season to date. Prices at various markets were generally about 1 cent above to 6 cents below the 1956-crop loan, except for white wheat at Portland which was 42 cents above the loan.

Prospects are that the new crop will be adequate for likely domestic needs and exports out of "free" supplies. Consequently, the usual seasonal decline in prices is again expected as the harvest approaches. The low for winter wheat probably will be reached in late June or early July, while the low for spring wheat will occur later. Moreover, "free" supplies of old-crop wheat expected to be on hand from now until July 1 are sufficient to take care of overall needs before the new crop becomes available, especially since wheat can be drawn from CCC supplies for export sales with subsidy payment-in-kind certificates. About 30 percent of the wheat exported by the private trade in the current year will come from such certificates.

Cash prices usually start down in mid-May. This year the decline may come a little earlier, if wheat is drawn from CCC supplies with export-subsidy certificates. As in the past, prices may again be expected to fall substantially below the announced loan. For example, the price of No. 2 Hard Winter at Kansas City in July 1955 and 1956 averaged 21 cents below

the announced rate. The difference between the market price and the loan in 1957 may not be this large because of the operation of the new export program, which has had an overall effect on raising the price level relative to the loan.

Prices can be expected to rise as the marketing season advances and heavy movement from farms slackens. For the marketing year 1957-58, prices to growers are expected to average around the announced loan rate of \$2.00 as in 1956-57. During the previous 5 years (1951-55 crops) prices to growers averaged about 11 cents below the announced rate.

On April 19 the Secretary of Agriculture proclaimed marketing quotas on the 1958 crop of wheat, and set June 20, 1957 as the date for referendum, and also proclaimed a national acreage allotment of 55 million acres, the minimum permitted by law.

The Secretary set the minimum national average support price for 1958-crop wheat in the 36-State commercial areas at \$1.78 per bushel, if quotas are approved. This price reflects 75 percent of estimated transitional parity and compares with \$2.00 for the average support price for the 1957 crop.

World trade in wheat may reach an unprecedented 1,150 million bushels in 1956-57, more than 80 million above the previous record of 1,066 million bushels exported in 1951-52. Exports at the level of 1,150 million would represent an increase of 11 percent over 1955-56 and 8 percent over those in 1951-52. The principal factor bringing about the expected record world wheat trade in 1956-57 was the poor 1956 winter wheat crop in Europe. This has resulted in very large increases in wheat exports to that area. Other important factors in the increased exports this year are the United States special export programs, an apparent general increase in the consumption of wheat in most areas of the world, and the return of the Soviet Union as a significant exporter, supplying import markets such as in Eastern Europe.

Seedings of winter wheat in Western Europe are about equal to those of a year ago. Total acreage for harvest is expected to exceed the low level of last year by about 10 percent, if present indications of spring plantings materialize. This would place total acreage near the high level of 1955 and, assuming normal growing conditions, above-average production prospects are indicated.

The supply position in Argentina is much improved compared with last year. This, together with the outlook for an above average crop in Western Europe, including France which may return again as an exporter, makes it seem quite likely that Europe will not provide as large a market for wheat from the United States, Canada and Australia in 1957-58 as has been the case this year. Western Europe in recent years has accounted for about 55 percent of the total world trade in wheat.

THE CURRENT DOMESTIC WHEAT SITUATION

BACKGROUND - The supply of wheat in continental United States increased from 1,420 million bushels in 1951-52 to 1,981 million in 1955-56. The 1951-55 average of 1,738 million bushels was 24 percent above the 1,397 million-bushel 1945-49 average, and 76 percent above the 985 million-bushel 1936-40 average. Total disappearance during 1951-55 averaged 965 million bushels, consisting of food, 488 million, including shipments to U. S. territories of 4 million and military food use at home and abroad; feed, 76 million; seed, 75 million; and exports, 326 million. Use for alcohol averaged only 0.4 million bushels. Carryover stocks at the end of this period, July 1, 1956, were 1,033 million bushels compared with 400 million bushels at the beginning.

Wheat prices to growers advanced from an average of 56 cents per bushel in 1938-39 to a record season average of \$2.29 for the 1947 crop. From 1938 to late 1944 the level of the loan rates under the support programs, which reflected the general rise in prices paid index, was an important factor in domestic wheat prices. From 1942 through 1945 wheat feeding was exceptionally heavy and large quantities of wheat were also subsidized for industrial use. In the latter part of the 1944-45 marketing year and for 3 years thereafter, export demand, stimulated by the various foreign aid programs, became the dominant factor. During this period prices averaged well above support levels.

After the harvests of record large crops in 1947 and 1948, and with relatively large crops again being produced in importing countries, the loan program again became an important price factor. The price to growers (which included unredeemed loans at average loan rates) for the 1948, 1951, 1952, 1954 and 1955 crops averaged about at the effective loan rate--announced rate less storage. The price to growers for the 1949 and 1953 crops, however, averaged about 7 and 8 cents, respectively, below the effective loan. With the new export programs in effect for the 1956 crop, prices have averaged about 9 cent above the effective loan.

Carryover July 1, 1957 Indicated
at 960 Million Bushels; Down 75 Million

The carryover July 1, 1957 is now expected to be about 960 million bushels, about 75 million bushels below the 1,033 million last July. The

CCC may own or control 1/ all but around 100 million bushels. This compares with 54 million bushels of "free" wheat a year earlier and 32 million bushels 2 years earlier. Larger supplies of "free" wheat are now needed by the private trade which has taken over a larger share of the export business under the new export program.

Stocks on June 30	256.0	605.5	933.5	1,036.2	1,033.4	962	880

1/ Preliminary. 2/ Projected. 3/ Excludes imports of wheat for milling-in-bond and export as flour. 4/ Includes shipments to United States territories and military food use at home and abroad. 5/ This is the residual figure, after all other disappearance is accounted for. 6/ Actual exports including those for civilian feeding under the military supply program. 7/ No basis for forecast at this time. Figure used for export is about the same as in 1955-56.

1/ A resale program for 1956-crop wheat in farm-storage under price support and an extension of loans on farm-stored 1955-crop wheat now under resale in certain States was announced March 8. Storage payments of 16 cents per bushel in some States and 17 cents in other States will be paid to producers who hold the wheat for the full year's resale period.

Total supplies of wheat for 1956-57 are indicated at 2,035 million bushels, including the carryover on July 1, 1956 of 1,033 million, the 1956 crop of 997 million an allowance for imports of 5 million bushels. With food use estimated at 483 million bushels, feed possibly 60 million, and seed at 55 million, total domestic disappearance is now indicated at about 600 million bushels. Exports totaled about 385 million bushels July through March, compared with 215 million bushels in the same period a year earlier. They are now expected to reach 475 million bushels for the 12 months ending June 30, 1957, compared with the earlier estimate of 450 million. On this basis, total disappearance would be 1,075 million bushels, and a carryover of about 960 million bushels would be on hand July 1, 1957.

CCC Stocks on April 1, 1957
 were 757 Million Bushels;
70 Million Below Year Earlier

Wheat stocks owned by CCC on April 1 this year totaled 757 million bushels (table 17), which is 70 million bushels less than the 827 million a year earlier. A report on total stocks, including wheat held by the Government, will be released on April 24. Last year total stocks on April 1 amounted to 1,323 million bushels, of which stocks not owned by the Government (including stocks under support but not delivered to CCC) amounted to 496 million compared with the 827 million owned by the CCC.

A report on CCC stocks on April 1 this year showed the following quantities in million bushels, by classes (1956 in parentheses): Hard red winter, 557 (596); hard red spring, 134 (128); soft winter, 2 (20); white, 63 (83) and durum, 1 (insignificant). (Table 18.)

The States in which CCC stocks on April 1 this year exceeded 10 million bushels, with last year's quantities for comparison, are shown in table 2.

Prices of Hard Winter
Wheat Near Season's High

The average price received by farmers in mid-March was \$2.07, which is the same price as a month earlier, and compares with \$2.09 in January, when the average was the high for the marketing year. In mid-March 1956 the average was \$1.97.

The loan program used with the other Government programs has been important in determining the general level of prices in 1956-57 as in every year since 1948. Through March 15, farmers had placed 251.3 million bushels of 1956-crop wheat under support (table 16), compared with 318.1 a year earlier. With loan withdrawals and deliveries by producers totaling 83.8 million bushels this year, there remained under the support program 167.5 million bushels on March 15. In addition, there were 13.1 million bushels of 1955-crop wheat under resale.

1-596
 827
 1323

Cash wheat prices on April 22 ranged from about 5 cents below the high for the season to date for hard red winter at Kansas City and 10 cents below for hard red spring at Minneapolis to about 22 cents below for soft red winter at St. Louis. The price of soft white at Portland, however, was near the high for the season to date. Prices at various markets were generally about 1 cent above to 6 cents below the loan, except for white wheat at Portland which was 42 cents above the loan. Prices at important markets are shown in table 3.

Usual Seasonal Price Decline

Expected; 1957 Crop May

Average at around Announced Loan

With prospects that the new crop will be fully adequate for likely domestic needs and exports out of "free" supplies, the usual seasonal decline in prices is again expected as the harvest approaches. The low for winter wheat probably will be reached in late June or early July while the spring wheat low will occur later. Moreover, overall "free" supplies of old-crop wheat expected to be on hand July 1 are sufficient to take care of overall needs before the new crop becomes available, especially since wheat can be drawn from CCC supplies for export sales with subsidy payments-in-kind certificates. About 30 percent of the wheat exported by the private trade in the current year will come from using such certificates. CCC continues to supply the wheat for exports covering barter, Title II of Public Law 480 and donation abroad.

1/ Cash grain closing prices are not the range of cash sales during the day but are on-track cash prices established at the close of the market. The terminal rate is a rate used in determining the effective support price for grain in terminal storage or in transit to terminal and for calculating most county price support rates. The effective support price is the established terminal support rate for grain received by rail minus the deduction for storage as of the date shown. A comparison of the above effective price support rate and the current cash closing price is an indication of whether the market price is above or below the support rate provided the location of the grain is on track at the specified terminals. The monthly average price is the simple average of the daily closing prices.

2/ Galveston effective and terminal support price. The cash price at Fort Worth is usually backed by paid-in freight which will carry it to Galveston. Therefore cash prices at Fort Worth may usually be compared with the effective support price at Galveston. A terminal support price is not established for Fort Worth.

3/ Applies only to the varieties Beart and Bluestem of the sub-class Hard White.

Cash prices usually start their downward movement in mid-May. This year the decline may come a little earlier if more wheat is drawn from the CCC for export sales by the use of the accumulated exported payment-in-kind certificates.

Prices may again be expected to fall substantially below the announced loan, as in the past. For example, the price of No. 2 Hard Winter at Kansas City in July 1955 and 1956 averaged 21 cents below the announced rate. The difference between the market price and the loan in 1957 may not be this large because of the operation of the new export program, which has had an overall effect of raising the price level relative to the loan.

As the marketing season advances, after the heavy movement slackens following the harvest, prices can be expected to begin to advance and, for the 1957-58 marketing year prices to growers are expected to average around the announced loan rate of \$2.00, as in 1956-57. During the previous 5 years (1951-55 crops) prices to growers averaged about 11 cents below the announced rate.

THE CURRENT WORLD WHEAT SITUATION

BACKGROUND - Supplies of wheat in four principal exporting countries--United States, Canada, Australia and Argentina--on January 1, 1944 were a record up to that time of 2,206 million bushels. War-time depletion of food supplies in importing countries and poor crops in many areas caused greatly increased disappearance from the exporting countries in 1945-47. By January 1947 supplies were down to 1,352 million but each succeeding year have been higher than the year before except in 1952. Supplies increased to 1,872 million in January 1951, but declined to 1,569 million a year later. They rose 36 percent to a record 2,274 million bushels in January 1953, as a result of large crops in each of the 4 countries in 1952. Then, supplies continued to increase and in the next 3 years rose 29 percent to an all time high of 2,942 million bushels on January 1, 1956. With record world exports more than offsetting increased production, supplies in the four countries were finally reduced again, though only slightly (table 20), to 2,867 million bushels on January 1, 1957.

Supplies of Wheat in 4 Exporting Countries Down 5 Percent

Supplies of wheat for export and carryover in the four principal exporting countries (United States, Canada, Argentina and Australia) on April 1 totaled 2,030 million bushels. This is 108 million or 5 percent below a year ago, but slightly above two years ago. The smaller supplies on April 1 for export and carryover reflect the heavy exports from the beginning of the season through March 31, since supplies, consisting of production and carryover stocks, were 100 million more this season than last. Exports of wheat, includ-

ing flour, from these 4 countries totaled 637 million bushels from the beginning of the marketing year through March 31, 1957. This is about 200 million more than in the same months last year. Exports from the United States the first 9 months of the marketing year totaled 385 million bushels compared with 215 million last season. Exports through March this year, in million bushels with comparable figures for last year in parentheses, were as follows: Canada 177 (158); Argentina 28 (37) and Australia 47 (31)(Table 23).

World 1956-57 Breadgrain Production
Near Record; World Wheat Production
Up While Rye Production Is Down 2/

A near record world breadgrain production is still estimated for 1956-57. Increasing world wheat production is offset by the downward trend in rye, resulting in the combined total of 267 million short tons for the current season. This is below the record total of 274 million tons for the 2 grains in 1952.

An increase of about 50 million bushels over the previous estimate for world wheat brings the present wheat total to 7,595 million bushels, a new record and 35 million above the previous high in 1952 (table 22). Revised estimates for the United States, parts of Western Europe and Argentina account for most of the increase from the estimate of December 10. An increase of about 25 million bushels in the estimated world total for rye brings that total to 1,385 million. Although larger than the earlier estimate, this is about 100 million bushels less than in 1955 and about 350 million bushels less than the prewar average. The increases over the earlier estimates are mainly in Eastern Europe, an important rye producing area, and in Argentina.

The wheat harvest in North America is now estimated at 1,576 million bushels. This is at the 1945-49 level and is well above the crops of the past 2 years. Somewhat larger harvests than in 1955 are reported for each of the three principal reporting countries. Increases in Canada and Mexico are attributed to higher yields while in the United States some increase over the very small acreage harvested in 1955 was also a factor.

Rye production in North America, at 30 million bushels, is the smallest outturn in many years. Reductions in both the United States and Canada were significant. Reduced acreage and smaller yields than in 1955 combined to bring production to this low point.

Wheat production in 1956 in Western Europe has been estimated at 1,211 million bushels. The reduction to this low level, the smallest since 1951, is mainly due to a sharp cut in the harvested acreage. Winter-kill in early 1956 in a number of countries, especially marked in France, necessitated shifting sizable acreages to spring planted crops. A large part of the shifted acreage went into feed grains.

2/ From Foreign Crops and Markets-World Summaries, March 1957

Growing conditions during the spring and summer were favorable in most areas, and yields were generally well above average though not up to the high 1955 yields in some countries. Unusually favorable yields for spring wheat were reported in a number of countries. Rye production for the area is estimated at 281 million bushels. This is larger than the 1955 crop and is about at the prewar level. Compared with that period, acreage shows a sharp reduction, offset by higher yields.

Grain production in Eastern Europe was somewhat smaller than the high 1955 outturn. Wheat production is estimated at 382 million bushels, 10 percent less than last year's crop. Smaller yields were the principal factor in the reduction, though a slight reduction in acreage is also indicated. The 1956 harvest is estimated to be 18 percent below the prewar average. Rye production in this area, estimated at 405 million bushels, is slightly less than the 1955 crop. Lower yields account for the reduction, with acreage appearing to be at the 1955 level.

Sharply expanded wheat acreage in the Soviet Union, together with somewhat higher yields of spring wheat, resulted in a sharp increase in the total wheat outturn. Weather conditions were highly variable. Most favorable conditions for spring wheat were reported east of the Volga, including the "New Lands" where a good part of the further expansion this year took place. Heavy losses during and after the harvest were attributed to unfavorable weather and inadequate transportation and drying and storage facilities. Reduced rye acreage this year meant another drop in rye production bringing it sharply below the prewar average.

Wheat production in Asia is placed at 1,845 million bushels, about 40 million bushels below the all time record crop last year. Increases in a number of countries partly offset a sharp reduction reported for Turkey. Rye production in this area is still sharply above average, though not up to last year's peak.

In Africa wheat production is still estimated at 210 million bushels, which is sharply above average and also above the 1955 total. Larger outturns than last year were reported for all major producers. Rye is of little significance in Africa.

Wheat production in South America is expected to be about 360 million bushels compared with 302 million last year and the 1935-39 average of 281 million. A large outturn in Argentina is the principal factor in the increase, offsetting reduced crops in most other countries of the area. The rye harvest in Argentina was one of the largest of record, now reported at 39 million bushels. This is the only rye producer of significance in the area.

Wheat production in Australia was sharply below average, still estimated at about 130 million bushels. A 25 percent reduction in acreage as a result of unfavorable weather at seeding time was the principal factor in the reduction. Yields, though not up to the high level of a year ago, were considerably above average.

World Wheat Trade in 1956-57
Expected to Exceed
Previous Record 3/

World trade in wheat may reach an unprecedented 1,150 million bushels in 1956-57, more than 80 million above the previous record of 1,066 million bushels exported in 1951-52. Exports at the level of 1,150 million would represent an increase of 11 percent over 1955-56 and 8 percent over exports in 1951-52

U.S. exports for the year are now estimated at 475 million bushels, considerably above the level of last year. Wheat exports from Canada and Argentina are estimated at about the same volume as in 1955-56, while Australia is expected to increase exports moderately over a year ago. Exports from other countries including Russia, Syria, Sweden, Uruguay and small quantities from the minor exporting countries, are expected to be about 150 million bushels in 1956-57 4/. The Soviet Union, the most important of this group, has export commitments totaling 150 million bushels and is expected to fulfill most of them.

The principal factor bringing about the expected record world wheat trade in 1956-57 was the poor 1956 winter wheat crop in Europe. This has resulted in very large increases in wheat exports to that area. Other important factors in the increased exports this year are the United States special export programs, an apparent general increase in the consumption of wheat in most areas of the world and the return of the Soviet Union as a significant exporter supplying in part markets such as Eastern Europe.

THE OUTLOOK FOR WHEAT IN 1957-58

BACKGROUND - In the 7 years ending with 1951-52, the United States was the leading exporter of wheat, with an annual average of 417 million bushels or 46 percent of the total world trade. In the previous 20 years, 1925-26 through 1944-45, exports had averaged only 81 million bushels, ranging from 4 million in 1935-36, following the previous drought years, to 144 million in 1944-45 at the close of the war.

U.S. exports declined about one-third in 1952-53, dropping to 318 million bushels. With a record 1952 crop in Canada, exports from that country again exceeded those from the United States, as was the case before 1945-46. In 1952-53, total world trade in wheat and flour declined to about 988 million bushels, 7 percent below the all time high of 1,066 million bushels in 1951-52. This reflected a record 1952 world wheat crop and larger wheat reserves in importing countries. It also reflected the negotiation of a truce in Korea and some easing in international tensions.

3/ From Foreign Crops and Markets, April 22, 1957. 4/ Exports, 1900-55, are shown in the Wheat Situation, October 31, 1956, page 31.

In 1953-54, world wheat trade declined to 879 million bushels, and the share of the United States also dropped. Larger quantities were available in other exporting countries, while requirements in major importing countries were less than in 1952-53. In 1954-55, world wheat trade increased 10 percent to 970 million bushels, and the United States exports rose 26 percent from 217 million to 274 million bushels. In 1955-56, world trade reached about 1,040 million bushels, second only to the 1,066 million in 1951-52. This increase reflected higher economic activity and greater purchasing power in importing countries, and also winter damage to the European crop.

Domestic disappearance has also declined from previous record levels. Disappearance in continental United States reached a peak of nearly 1.2 billion bushels in 1943 when 108 million bushels were subsidized for use in making alcohol for war purposes: 511 million used for feed to supplement regular feed supplies largely as the result of a subsidy program. With negligible quantities of wheat used for alcohol in peace time, feed use currently at only around 60 million bushels, and some reduction in wheat for food and seed, current continental domestic disappearance is only about 600 million bushels.

Substantial Reduction in
Carryover Possible as Result
of Reduction in Production

The winter wheat crop was forecast at 669 million bushels as of April 1. The first estimate of spring wheat production will be made June 10. If some increase in acreage over intentions is assumed for durum as a result of recent legislation 5/, and a slight decrease from intentions in other spring acreage is made, about average yields would produce a total spring wheat crop of about 190 million bushels.

In the March intentions report, farmers indicated that they would seed 1.7 million acres of durum. As a result of the subsequent legislation, this might be increased to 2.2 million acres. Assuming a yield per seeded acre of 15.6 bushels (the same as last year) a crop of about 34 million bushels is indicated. Allowing for a slight decrease from the intended acreage of other spring wheat from 11.1 to 11.0 million acres and assuming 1947-56 average yields of 14.2 bushels, a crop of 156 million bushels would be produced.

5/ The durum program (Public Law 85-13) is available to farmers in designated counties of California, Minnesota, Montana, North Dakota and South Dakota, where Durum (Class II) was produced in one or more of the 5 years, 1952 through 1956. In these counties, farmers may produce 2 acres of durum for each acre of their farm wheat allotment not planted to other wheat to the extent that the allotment is not signed up under the Acreage Reserve Program. The increase in the allotment is limited to 60 acres.

If the spring crop, including durum, should be about 190 million bushels, and if 669 million bushels of winter wheat are produced, total production would amount to around 860 million bushels. Imports are likely to be about the same as the 5 million bushels estimated for 1956-57.

With total disappearance of possibly 950 million bushels (600 million domestic and possible exports of 350 million), the carryover at the end of the 1957-58 marketing year would be about 875 million bushels, a reduction of around 85 million bushels from the estimated carryover of about 960 million bushels on July 1, 1957.

A wheat crop of 860 million bushels would be 14 percent below the 997 million bushels produced in 1956 and 24 percent below the 1946-55 average of 1,131 million bushels. The reduction results from drought conditions at seeding time in important hard winter wheat States and the operation of the Soil Bank Acreage Reserve Program. As of April 12, farmers had signed up 12.82 million acres of wheat under the 1957 Program. Maximum payments on this acreage would total 231 million dollars. This acreage includes winter wheat agreements signed last fall, less cancellations, plus spring wheat agreements signed through April 5.

Winter Wheat 9 Percent Below
1956; 44 Million Bushels
Above December Forecast

Winter wheat conditions on April 1 indicated a crop of 669 million bushels. This would be 9 percent smaller than the 1956 crop of 735 million bushels, 22 percent less than average but 44 million bushels above the December 1 forecast. Increases from prospects as of December 1 have been general throughout the country in central and northern Plains States. Improved prospects in Washington, Colorado, Montana, Texas, Oklahoma, Indiana and Illinois account for most of the increase in indicated production.

The indicated yield of 18.2 bushels per seeded acre is the same as 1947 which is the second highest of record and compares with 16.5 in 1956 and the average of 15.9 bushels. The current estimate is based on an appraisal of the April 1 condition of wheat as reported by individual growers, and on soil moisture reserves and other factors affecting production.

In the last 10 years, the average change in the United States production estimate from April 1 to harvest has been 95 million bushels. Some years have been above and others below. The maximum change was in 1953 when final production exceeded the April 1 forecast by 171 million bushels. The minimum change was in 1956 when the harvest was 19 million bushels more than the April 1 forecast.

Total abandonment and diversion to uses other than grain are indicated at 6.3 million acres, 17.1 percent of the total acreage seeded for all purposes last fall and winter. This is slightly less than the percent indicated last December. Of the 6.3 million-acre total, 4.5 million acres are in Texas, Oklahoma, Kansas, Colorado and New Mexico. For the United States last year, 8.9 million acres or 19.9 percent of the total acreage seeded were lost or diverted.

In the important wheat States in the central and southern Plains area, wheat prospects improved on the acreage remaining for harvest as intermittent rains and snows covered most areas of the hard winter wheat belt. Moisture conditions on April 1 were the best in several years. However, abandonment will be heavy in the Panhandle area of Oklahoma and Texas, southeast Colorado and western Kansas. Moisture in these areas came too late to save much of the seeded acreage.

In Kansas, heaviest loss of acreage has occurred in the western half of the State where continued dry weather through February and extremely high winds about mid-March resulted in heavy acreage losses. Early spring precipitation in the form of rain and snow greatly improved soil moisture conditions throughout the State. Spring rains caused some sprouting of wheat drilled in dry soil the previous fall, but wheat germinating this late is not expected to yield well.

In the Panhandle area of Oklahoma and Texas, the critical drought condition that existed was relieved by generous rainfall during late winter and early spring. Fields with stands showed marked improvement as warmer temperatures and adequate moisture promoted rapid growth. This area generally has sufficient moisture to maintain plant growth for some time but will need additional moisture to produce a favorable yield. Central and eastern areas of Oklahoma have ample moisture with most fields showing an abundant growth.

Winter wheat prospects in Nebraska remained about the same as December 1, as winter months brought only limited moisture and the absence of snow cover encouraged damage by high winds. Moisture fell during late March, continuing into early April. A significant acreage emerged late and showed only limited growth by April 1.

In Colorado, drought conditions at seeding time persisted until late winter. Much acreage did not survive the winter and early spring ravages of drought and excessive winds. Wheat that survived is mostly well rooted and should be benefited by moisture that fell during late March and early April. East central and southeastern areas of the State have only a relatively small percentage of their seeded acreage remaining for harvest. In New Mexico, only a small percentage of the acreage seeded last fall remains for harvest, with most of the remaining acreage on irrigated land.

The Pacific Northwest reports wheat in excellent condition with winter losses expected to be moderate. Some fields show thin stands due to late fall seeding. But moisture is plentiful, and the arrival of warmer weather should bring on rapid growth.

The Atlantic States and the South Central States east of Oklahoma and Texas generally report production increases over December 1. The crop was seeded under favorable conditions, with adequate winter moisture to provide excellent early spring yield prospects. Winter losses are reported to be minor. Plant growth on April 1 ranged from normal in North Atlantic areas to well advanced in Southeastern and South Central areas.

North Central States show a rather wide range of conditions with the more northerly States experiencing rather poor conditions. A considerable acreage was "dusted-in" last fall and received moisture too late to promote normal plant growth prior to the dormant period. The area has adequate spring moisture, and warm weather is expected to stimulate rapid plant growth.

Minimum Support for 1957 Wheat
Crop Announced at \$2.00,
Same as for 1956

The minimum national average support price for the 1957 crop was announced on July 2 at \$2.00, the same as the final support rate announced for the 1956 crop.

Full support will be available in the 36 commercial wheat States for producers who comply with their individual farm acreage allotments. Support rates for wheat produced in the 12 noncommercial wheat States are set by law at levels representing 75 percent of the rates calculated on the national average. In the noncommercial States, acreage allotments and marketing quotas will not apply. Production in the 12 noncommercial States in 1956 amounted to 5 million bushels, only about one-half of one percent of the total United States production.

Undesirable Wheat Varieties
Discounted Under 1957
Support Program

A discount of 20 cents per bushel in 1957 price-support rates was announced August 14 for 23 wheat varieties designated as undesirable because of inferior milling or baking qualities.

The application of the discount of 20 cents per bushel to producer-support rates will be the same as under the 1956 operation, when such discounts were included in the price-support program for the first time. The price-support regulations for the 1957 program will provide for producer certification regarding undesirable varieties similar to the certifications made by producers for the 1956 operation. These varieties generally are

difficult to determine from threshed samples of wheat, and the identification of the variety going under price support will be the producer's responsibility based on his knowledge of the varieties he seeded and harvested. Although some of the undesirable varieties might have protein content high enough for a premium, no protein premiums will apply to any of the undesirable varieties in determining the loan rate; similarly, no amber or hard amber durum premiums will apply.

Experience during the past year has indicated that the undesirable varieties should be designated nationally instead of by States as for the 1956 support operation. The only exception is Henry, a hard red spring variety, which is named as undesirable in all but the States of Wisconsin and Washington.

The 23 varieties of wheat named as undesirable for the 1957 wheat support program follow by class: Hard Red Winter.- Stafford, Pawnee Sel. 33, RedChief, Chiefkan, Early Blackhull, RedJacket, Kanking, NewChief, BlueJacket, Purkof, Cimarron, Red Hull. Soft Red Winter.- Kawvale. Hard Red Spring.- Henry (except in Wisconsin and Washington), Spinkcota, Premier, Sturgeon, Progress. Durum.- Pentad, Golden Ball, Peliss. White.- Rex, Sonora.

Improved Wheat Prospects in Western
Europe Indicate Lower Import
Needs in 1957-58 6/

Plantings of winter wheat in Western Europe are about equal to those of a year ago. Total acreage for harvest is expected to exceed by about 10 percent the low level of 47,000 acres last year, if present indications of spring plantings materialize. This would place total acreage near the high level of 1955 and, assuming normal growing conditions, above average production prospects are indicated.

Last season's outturn of 1,211 million bushels for the area was the smallest since 1951, mainly because of extensive winter-kill in February of 1956. This compares to the 1955 production of 1,389 million bushels and the past 5-year average of 1,294 million bushels. In addition, the quality of the 1956 crop was poor. Winter-kill has not been an important factor this season and recent weather conditions have been reported as generally favorable. Crop prospects thus far are promising for most sections of Europe.

Spain is the only major producing country of the area where the prospects for the wheat crop are less favorable than last year. This is attributed to the prolonged drought during the fall and early winter. Rains during January and February, however, have greatly improved prospects for winter wheat and a fair crop may still be harvested if favorable weather conditions continue. Current official estimates, however, place this year's Spanish wheat crop considerably below normal.

6/ From Foreign Crops and Markets, April 1, 1957.

Plantings of spring wheat in France are again expected to be high in spite of urging by the Government that farmers plant larger acreages to barley. France's total wheat acreage for harvest will thus materially exceed last year's and a surplus is expected if normal weather conditions continue. In anticipation of a large wheat harvest, France may well taper off her imports toward the end of this year to conserve foreign currency and enter the new year with minimum carryover stocks. Reduced imports may also be expected in some of the other importing countries, though not to as great an extent as in the case of France.

Exports of wheat to Europe by the 4 major overseas exporters (United States, Canada, Australia and Argentina) for the first 7 months (July 1956-January 1957) of this crop year have already exceeded 330 million bushels. This compares with an annual average (12 months) for the past 5 years of 426 million bushels. Through February, U. S. exports of wheat to this area had already exceeded total exports for the entire 1955-56 year and are expected to continue at a high rate. Exports may possibly taper off near the end of the year in view of production prospects already outlined above. Canadian and Australian exports to Western Europe, July-January, are running well ahead of the first seven months of last year. Argentina is the only one of the Big Four with reduced exports to Western Europe from a year ago. This is due, however, to Argentina's small exportable surplus from the 1955 crop, and her exports should pick up substantially with the recent above-average harvest.

In view of the much improved supply position in Argentina, the outlook for an above average crop in Western Europe, and the possible return of France to the export market, it seems quite likely that Europe will not provide as large a market for wheat from the United States, Canada and Australia in 1957-58 as the case has been this year. Western Europe, in recent years, has accounted for about 55 percent of the total world trade.

Decline of 7 Percent in All Wheat
Indicated for Canada; However, Durum
Intentions Indicate 5 Percent Increase

The Canadian wheat acreage for 1957 will be 7 percent below last year, practically all of the decrease will be in the Prairie Provinces, if farmers carry out their March 1 planting intentions. The 1957 acreage for all wheat estimated at 19.88 million acres by the Dominion Bureau of Statistics compares with 21.34 million acres planted for the 1956 crop. A major part of the anticipated decline is in the Province of Saskatchewan, where a reduction of 8 percent from 1956 seedings is indicated. The prospective acreage to be seeded to all wheat is the smallest since 1943-44, when a special war-time acreage reduction program was in effect. With this exception, intended acreage is the smallest since 1920 when settlement of the western prairie area was nearing completion. In issuing the report, the Bureau emphasized that the intended acreages in the report were merely indicative of farmer's plans at March 1. Acreages actually seeded, therefore, might vary considerably from

the intentions, depending upon conditions before and during seeding. Additional factors which may contribute to changes in acreages, it was pointed out, include availability of good quality seed, contractual arrangements, the market outlook and the possible effect of the report itself on farmers' plans.

The decrease of almost 1.4 million acres of spring wheat in the Prairie Provinces, from the 1956 level of 20.6 million, is the largest individual shift indicated in the use of Canadian crop land in 1957. The prospective decrease in bread wheat is 2.2 million acres, whereas durum acreage may increase by 0.8 million acres, from 1.7 million last year to 2.5 million in 1957.

ANNOUNCEMENTS FOR 1958-CROP WHEAT

Marketing Quota Referendum for 1958 Crop Set For June 20

The Secretary of Agriculture on April 19 proclaimed marketing quotas for the 1958 wheat crop, subject to approval by growers voting in a referendum on June 20 ^{7/}. Growers affected by the marketing quotas--those in the commercial wheat States who will have more than 15 acres of wheat for harvest as grain on a farm in 1958--are eligible to vote in the referendum. Two-thirds of the vote in the referendum must favor marketing quotas before they can be put into effect.

If quotas are approved, producers in commercial wheat States who stay within the acreage allotted for their farms will be eligible for the full level of price support. Producers in commercial States who do not comply with their allotments will not be eligible for price support and will be subject to marketing quota penalties on their excess wheat, if they have more than 15 acres for harvest.

If quotas are not approved by wheat growers in the referendum, the law provides for a wheat price-support level at 50 percent of parity for producers who stay within their acreage allotments. Farmers may exceed their allotments without being subject to quota penalties, but they will not be eligible to receive any price support.

^{7/} The Secretary of Agriculture is directed by legislation to proclaim marketing quotas for the next wheat crop when the available supply is 20 percent or more above normal. The estimated supply available for the 1957-58 marketing year is actually 56 percent above the normal supply. Marketing quotas have been in effect for six years. These are, with the percentage approval of farmers voting, as follows: 1941, 81.0 percent; 1942, 82.4 percent; 1954, 87.2 percent; 1955, 73.3 percent; 1956, 77.5 percent and 1957, 87.4 percent.

In the noncommercial States ^{8/}--States having wheat allotments of 25,000 acres or less--farm wheat allotments and marketing quotas, if approved, do not apply.

National Allotment Set at 55 Million
Acres; State Allotments Announced

At the same time that the Secretary proclaimed the national marketing quota, he established the national acreage allotment for the 1958 crop at 55 million acres, the level specified by law under present conditions of excessive supply. Legislation provides for establishing a national wheat acreage allotment each year except in the event of a national emergency or a materially increased export demand for wheat. If the allotment had been determined on the basis of the law's supply formula, the 1958 acreage would have been 23 million acres. 1958 will be the fifth successive year that wheat acreage allotments have been in effect ^{9/}.

State acreage allotments for wheat were also announced. These, together with allotments of the past 3 years, are shown in table 13. The 1958 allotments in the principal wheat producing States do not differ greatly

^{8/} States included in the noncommercial area are: Alabama, Arizona, Connecticut, Florida, Louisiana, Maine, Massachusetts, Mississippi, Nevada, New Hampshire, Rhode Island and Vermont.

^{9/} Acreage allotments for wheat have been in effect 9 times since 1938, as follows:

Year	Allotment	Actual seedings	Year	Allotment	Actual seedings
	Million acres	Million acres		Million acres	Million acres
1938	62.5	79.0	1950	72.8	71.3
1939	55.0	62.8	1954	62.8	62.5
1940	62.0	61.8	1955	<u>1/55.8</u>	<u>2/58.2</u>
1941	62.0	62.7	1956	55.0	<u>2/60.7</u>
1942	55.0	53.0	1957	55.0	<u>3/50.0</u>

^{1/} National acreage allotment of 55 million acres was proclaimed but mandatory legislation giving credit for summer fallow and granting additional acreage for durum wheat increased total effective allotment to 55.8 million acres. ^{2/} Beginning with 1955-crop wheat, allotments were on the basis of wheat harvested as grain, after taking into consideration natural abandonment. ^{3/} Winter wheat seedings plus spring wheat intended seedings adjusted for durum increase.

Acreage allotments were proclaimed for the 1943 crop (allotment, 55.0; seedings, 56.0) and 1951 crop (allotment, 72.8; seedings 78.1), but were terminated under the emergency powers of the governing law, after winter wheat was planted. Acreage allotments for the crops of 1944-49, inclusive, and for 1952 and 1953 were dispensed with also under the emergency powers.

from those established last year when the national allotment was also 55 million acres. Each wheat producer will be informed of the acreage allotment for his farm in advance of the wheat marketing quota referendum. Farm wheat allotments and marketing quotas, if approved, do not apply in the noncommercial areas.

Minimum Support for 1958-Crop Wheat
Announced at \$1.78; 1957 was \$2.00

On April 19 the Secretary also set the minimum national average support price for the 1958-crop wheat, available to eligible producers in the commercial area, at \$1.78 per bushel, if quotas are approved. This price reflects 75 percent of estimated transitional parity 10/. For price-support computations, the wheat supply is estimated at 141.8 percent of the normal supply and indicates a minimum support level of 75 percent of parity.

This minimum average support will not be reduced but may be increased if a combination of the wheat parity price as of July 1, 1958 and the wheat supply relationships as of that same date indicate a higher support price.

The full support level will be available in the 36 commercial wheat States for producers who comply with their individual farm acreage allotment. Support rates for wheat produced in the 12 noncommercial wheat States are set by law at levels representing 75 percent of the rates calculated on the national average.

Marketing quota penalties equal to 45 percent of the wheat parity as of May 1, 1958 will be assessed against the normal yield of wheat grown on acres in excess of the wheat acreage allotment 11/, except that no excess

10/ The \$1.78 per bushel minimum national average support price for 1958-crop wheat is based on current parity (\$2.50 per bushel as of March 15, 1957) with an allowance for an additional 5 percent yearly transitional move toward the "modernized" wheat parity price which resumes January 1, 1958. The new or modernized formula recognizes change by considering price relationships in the most recent 10-year period. Wheat started the transition in 1956 to parity levels under the modernized formula as required by law. This transition was delayed for the year 1957 by legislation but will resume in 1958. The downward adjustment in parity cannot exceed five percent in any one year. The wheat parity price as of March 15, 1957 was \$2.50 per bushel. Allowing 5 percent change in each of the years 1956 and 1958 from the base parity price of \$2.63 per bushel, the estimated parity for 1958 will be \$2.37 per bushel. The \$1.78 per bushel minimum support is 75 percent of this "transitional" parity.

11/ If the producer can prove to the County Committee that the actual yield per acre of wheat is less than the normal yield per acre, the farm marketing excess may be adjusted downward.

wheat is determined for farms on which wheat acreage is 15 acres or less. After the penalty is paid, the producer is free to dispose of his wheat in any way he chooses.

Payments of marketing penalties on excess wheat can be avoided or postponed by withholding the excess wheat from the market--either by storing it on the farm or in a warehouse, or by delivering it to the Secretary of Agriculture for relief use or diversion, under regulations established by the Secretary. After the producer has met any of these requirements on excess wheat, he will receive a marketing card as evidence that no penalties are due. Excess wheat fed on the farm is considered as having been marketed and is subject to the penalty.

NEW OFFICIAL GRAIN STANDARDS FOR WHEAT

Important Changes in Wheat Standards

A revision of the official grain standards for wheat was announced March 8. The revision, which becomes effective June 15, will have the effect of improving the quality of wheat represented by the U. S. grades. Prior to the current revision, wheat standards had been without major change since 1934.

Important changes being made in the wheat standards are as follows:

(1) A reduction in the limits of total foreign material to 0.5 percent, 1.0 percent, 2.0 percent and 3.0 percent in grades 1, 2, 3 and 4, respectively, compared with 1.0 percent, 2.0 percent, 3.0 percent and 5.0 percent now permitted. The factor, "matter except other grains," is eliminated. (2) A reduction in shrunken and broken kernels in No. 1 and No. 2 to 5.0 percent and in No. 3 to 8.0 percent. Present tolerances are 7.0 percent for No. 1 and No. 2 and 10 percent for No. 3. (3) A reduction in the limits of wheat of other classes in No. 2 grade to 5.0 percent. Present tolerances are 5 percent, for grade No. 1 and 10 percent for Nos. 2 and 3. (4) An increase in the minimum limits of dark, hard and vitreous kernels in the subclass Hard Winter Wheat from "more than 25 percent" to 40 percent. (5) The elimination of "Amber Mixed Durum" and "Mixed Durum" from the grade designation in the class Mixed Wheat. (6) A provision that distinctly low quality be determined on the basis of the sample as a whole, that is, before the removal of dockage.

Additional changes of minor significance are being made in order to clarify and simplify existing standards. No change is made in the method of expressing dockage, which will continue to be in terms of whole percents or in the present method of evaluating smutty wheat. The limits of moisture for the special grade "tough wheat" are unchanged for all classes.

The definition of "sample grade" remains unchanged with no reference to contamination by "animal filth." Wheat which is distinctly contaminated will continue to be interpreted as "distinctly low quality" as in the past, with emphasis on uniform interpretation and application.

New Futures Trading Contracts

Since the revision in the wheat standards was announced, both the Kansas City Board of Trade and the Minneapolis Grain Exchange have initiated trading in both "old" and "new" wheat futures contracts. The "old" means trading in wheat under the present standards, while "new" means trading under revised standards. At Kansas City transactions in "old" contracts are limited to liquidation only. However, deliveries may be made under the present standards if any open interest remains in the option. At Minneapolis, trading is authorized on the basis of both "old" and "new" standards calling for delivery in July and September 1957. Beginning June 15, 1957, trading in "old" contracts will be permitted for liquidation purposes only. Trading in December wheat futures is permitted on the basis of the revised wheat standards only. Transfer of contracts from "old" to "new" must be made on a no-fee basis. At Chicago, trading authorized is the same as at Minneapolis, except that December is also included in addition to calling for delivery in July and September.

SOME HIGHLIGHTS OF 1955 FOOD CONSUMPTION SURVEY

Flour Consumption Decreases While
Bread Consumption Increases
With Higher Incomes

Based on the Survey of Household Food Consumption in the United States in a week in the spring of 1955 ^{12/}, consumption per person (21 meals) was calculated by urbanization and income groups as shown in table 4. The survey reports also include, among many other data, information for income groups below \$2,000 and over \$8,000. These have not been included in this analysis in order to simplify the presentation and because the number of households surveyed at the two ends of the income scale are relatively small and are less representative.

The findings indicate that the use of white flour per person decreased sharply as incomes increase. For prepared flour mixes, the low-income group has the lowest consumption. On the other hand, for baked goods generally, as well as ready-to-eat wheat breakfast cereals, use increases with incomes.

The increase in use of white bread as incomes increase is moderate, with use of whole wheat and other bread generally low in the first 2 groups and highest in the \$5,000 - \$5,999 group. Consumption of rolls and "other baked goods" (cookies, doughnuts, sweet buns, etc) also generally increases as incomes rise. For biscuits and muffins, use tends to increase as incomes rise, with low use in households with low incomes and high in highest groups. For cakes and pies, use also tends to increase as incomes go up.

^{1/} Based on data in Food Consumption of Households in the United States, U.S.D.A. 1955, Household Food Consumption Survey Report No. 1 (1956).

^{2/} Flaked, puffed and shredded.

^{3/} Sweet and not sweet.

^{4/} Ready-to-eat and brown-and-serve.

^{5/} Includes cookies, doughnuts, sweet buns, coffee cakes, etc.

^{6/} Farm-operating household.

^{7/} In communities with population of 2,500 or more and in fringe areas of large cities.

^{8/} Outside urban areas but not operating farms.

The survey provides details on consumption for the farm, and nonfarm households. The latter consists of urban and rural nonfarm groupings. The farm consists of farm operating households. Urban households are those located in communities with population of 2,500 or more and in fringe areas of large cities. Rural nonfarm are households outside urban areas but not operating farms.

As shown in table 1, farm use of white flour is sharply higher than nonfarm, and of ready-to-eat wheat breakfast cereals slightly higher than nonfarm, with rural nonfarm higher than urban in both cases. However, the use of prepared flour mixes is slightly higher for nonfarm than for farm households.

On the other hand, the nonfarm use of white bread is moderately above the farm rate, with rural nonfarm higher than urban. The \$6,000-\$7,999 income group has highest rate for the United States as a whole, reflecting heavy nonfarm use by both urban and rural nonfarm groups. For rolls and "other baked goods" (cookies, doughnuts, sweet buns, etc.) nonfarm use is slightly higher than farm, with urban above the rural nonfarm. The nonfarm use of biscuits and muffins is also higher than for farm. While nonfarm cake use tends to increase with income, the rural nonfarm rate for the sample shows some falling off in the upper income groups. In the case of pie consumption, highest farm use is in the \$3,000 - \$3,999 and \$5,000 - \$5,999 groups. With only 4 percent of the farm households reporting use of purchased pies, these data are subject to considerable sampling error.

For hot wheat breakfast cereals, the survey shows little variation in use, with farm rates slightly higher than nonfarm. Also, in the use of macaroni and related products, there is little income variability, with the tendency for highest income group to drop off. Nonfarm use is moderately above farm.

Urban White Flour Consumption Between
1948 and 1955 Down 26 Percent;
White Bread Down 15 Percent

The consumption per person in urban households in a week in the spring of 1955 is compared with that in the spring of 1948 ^{13/} in table 5. The comparison is only for urban households, because the detailed survey in 1948 was limited to that coverage, and accordingly excludes changes in the rural segment of the market and the effect of rural-urban shifts.

The table indicates that white flour consumption per person declined 26 percent between 1948 and 1955. Whole wheat and other flour went up 100 percent and prepared flour mixes were up 111 percent.

^{13/} The 1948 data was based on figures in Food Consumption in Urban Families in the United States, U.S.D.A., 1948. Information Bulletin No. 132 (1954).

Bread consumption also dropped. White bread declined 15 percent and whole wheat and other bread 27 percent. On the other hand, baked goods other than bread were generally higher, with the exception of cakes, which were down 7 percent. The greatest increase was in pie consumption, which was up 71 percent. Here again, with only a small sample of households reporting use of purchased pies, these data are subject to considerable sampling error.

Consumption of macaroni, spaghetti, noodles, etc. was up 3 percent. It may be pointed out that while consumption of wheat products in the aggregate is down, that of macaroni and related products appears to be increasing in recent years.

Table 5.- Wheat products: Consumption per person in urban households in a week, United States, April-June 1948 and 1955 surveys 1/

Coverage and product	1948	1955	Change from 1948 to 1955 <u>2/</u>
	<u>Pounds</u>	<u>Pounds</u>	<u>Percent</u>
Product weight

Macaroni, spaghetti, noodles, etc. <u>6/</u>	.14	.15	+3
Total of above, flour equivalent <u>7/</u>	2.24	2.00	-11

1/ Based on data in Food Consumption in Urban Families in the United States, U.S.D.A., 1948, Information Bulletin No. 132 (1954); and Food Consumption of Households in the United States, U.S.D.A., 1955; Household Food Consumption Survey, Report No. 1 (1956).

2/ Computed from consumption per person carried out 3 decimal places.

3/ Includes cracked wheat, raisin and rye bread.

4/ In 1948, 1,370 pounds per person were enriched and 0.063 pounds per person unenriched. In 1955 practically all flour was enriched.

5/ Includes cookies, doughnuts, sweet buns, coffee cake, etc.

6/ Includes dry and ready-cooked products.

7/ Total used in all urban households.

The overall decrease in consumption of wheat products, except breakfast foods, in urban households per person, measured in terms of flour equivalent, amounted to 11 percent compared with a decrease of 10 percent in the total U. S. consumption of all wheat products, except breakfast foods, from 1948 to 1955. The 1948 average per capita consumption, in flour equivalent, was 126 pounds against 122 pounds in 1955 on an annual basis and 2.6 pounds and 2.3 pounds, respectively, on a weekly basis.

A direct comparison between household consumption data covering a week obtained from a one-time survey and annual per capita flour consumption data (table 6) can not be made for two reasons: (1) While the former includes purchases by households only, the latter involves the total flow into civilian distribution, including not only households, but restaurants, school lunches, manufacturing plant facilities and other private institutions and institutions of public nature. Moreover, (2) the household information might be affected by seasonality, while the overall consumption figure represents the annual total.

Rates of Flour Use in 1955 Close to
1942 and 1948 For Income Groups Above
\$2,000; Use of Baked Goods Definitely
Lower Up to \$6,000 Income Point in 1955 14/

A further analysis was made to determine changes from 1942 ^{15/} to 1948 and 1955 in the patterns of urban wheat flour and cornmeal ^{16/} and of bakery products. In order to expedite such comparisons, the average dollar incomes after income taxes of each group of households reported for 1941 and 1947, the years before the spring survey, was increased by the increase in the consumer price index, thus converting these incomes into approximate 1954 dollars. The perperson quantities were plotted against average money incomes per household after taxes, using double logarithmic paper, which shows rates of change. The chart pointed up the following with regard to patterns of urban use:

- (1) The relationships of per person consumption to approximate average real income developed from the 3 sets data for both groups of commodities (flour and meal, and bakery products) were remarkably similar.
- (2) The level of consumption of baked goods was definitely lower up to the \$6,000 income point in 1955 than in 1942 and 1948.
- (3) Having included flour mixes with flour and meal, the rates of use in 1955 ran close to those of earlier years for each income group above \$2,000.

^{14/} Contributed by Marguerite C. Burk, AMS.

^{15/} The 1942 data were based on figures included in Food Consumption in Urban Families in the United States, U.S.D.A., 1948, Information Bulletin No. 132 (1954)

^{16/} Cornmeal averaged .12 pounds per person in 1942, .14 pounds in 1948 and .11 pounds in 1955.

(4) The changes in the average rates of consumption noted above reflect some changes in the distribution of the urban population by income. We now have more people in the lower range part of the curves for flours and meal and in the higher part for baked goods.

(5) The survey data indicate a definite leveling off in consumption of baked goods for high income groups.

(6) Whereas the 1948 survey showed some leveling off of the down curve for flour and meal consumption by the highest income group, further decline is indicated by the 1955 survey data.

From these sets of survey data, it is evident that if during coming years of rising income, urban families follow the present lead of higher income households, some further decreases in per capita use of flour and meal in all forms appears likely. Moreover, the situation would be aggravated, from the wheat farmers' and millers' point of view by farm-urban population shifts and the apparent downtrend in rural consumption rates for flour and meal in various forms.

Consumption in South and North
Central Regions Compared 17/

Flour use in the South was noticeably higher in each income level up to the \$8,000 - \$9,999 group. Prepared foods were generally more popular in the North Central Region than in the South. Half as much cake mix was used per household in the South as in the other regions, but use of cookie and pie mixtures were more similar. As might be expected from the emphasis on hot breads the consumption and brown-and-serve rolls in nonfarm households in the South was higher than in the North Central Region.

Urban households in the \$4,000 - \$4,999 income group of the South consumed about the same amount of flour in all forms as those in the North Central Region. But southern rural groups consumed sharply more of the flour, cereal and bakery product groups combined than did urban families of the South or similar groups in the North Central Region. Use of purchased bread and other baked goods in the South was below rates for comparable households in the North Central Region up to the \$8,000 - \$9,999 income level.

17/ Based on data in Food Consumption of Households in the North Central Region, U.S.D.A., 1955, Household Food Consumption Survey Report No. 3 (1956) and in the South, Survey Report No. 4. The report for the Northeast has also been published and is Report No. 2, and that for the West is Survey Report No. 5.

1/ Commercial production of wheat flour (reported by Census) includes flour milled in bond from foreign wheat plus the estimated flour equivalent of farm wheat ground for flour or exchanged for flour for farm household use as reported by AMS. 2/ Commercial deliveries for export include milled-in-bond flour made from imported wheat. 3/ U.S.D.A. procurement for export other than supplies for civilian relief feeding in occupied areas. 4/ Commercial deliveries for export and U.S.D.A. procurement for export of semolina, macaroni, and bakery products in terms of flour. 5/ Includes other products in terms of flour in addition to flour per se. Covers supplies for civilian relief feeding in occupied areas as well as those for direct use of U.S. Armed Forces. 6/ Preliminary.

1/ Exports exclude shipments by military for civilian feeding, and exports of flour from foreign wheat milled in bond.
2/ U. S. wheat and flour used with foreign wheat in milling in bond for export.
3/ USDA flour procurement rather than deliveries for export.
4/ Shipments, partly estimated, are to Alaska, Hawaii, Puerto Rico, Guam, Samoa, Virgin Islands and Wake Island.
5/ Includes procurement for both civilian relief feeding and for military food use; military takings for civilian feeding in occupied areas measured at time of procurement and not at time of shipment overseas.
6/ Includes relief exports for charity by individuals and private agencies of wheat and flour in wheat equivalent, in thousands of bushels, as follows: Jan.-June 1956, wheat, 2,788; July-Dec. 1956, wheat, 1,038 and flour, 1,182.

Jan.-June	1,487,479	---											

1/ Includes flour and other wheat products in terms of wheat. 2/ Only old-crop wheat is shown in all stocks positions. 3/ Imports include full-duty wheat, wheat imported for feed, and dutiable flour and other wheat products in terms of wheat. They exclude wheat imported for milling in bond and export as flour, also flour free for export. 4/ Includes procurement for both civilian relief feeding and for military food use; military takings for civilian feeding in occupied areas measured at times of procurement, not at time of shipment overseas. 5/ Exports as here used in addition to commercial exports of wheat, flour and other wheat products, include United States Department of Agriculture flour procurement rather than deliveries for export. 6/ To Alaska, Hawaii, Puerto Rico, Guam, Samoa, Virgin Islands and Wake Island; partly estimated. 7/ Preliminary. 8/ Includes exports of 2,788,000 bushels for relief or charity by individuals and private agencies. 9/ For the period July-December 1955, known disappearance from the July 1 supply, without an allowance for quantities fed, is about 12 million bushels larger than that indicated by January 1 stocks. This discrepancy may be accounted for by possible inexactness in data, including some duplication in stocks reported in the various positions by different agencies. 10/ Includes exports of 2,220,000 bushels for relief or charity.

Data for earlier years are shown in the Wheat Situation, February 28, 1957; for marketing years, 1935-53, on page 20 and for six-month periods on page 21.

1/ Excludes Red Durum, Class III.

2/ Carryover of old-crop wheat; grain only.

3/ Estimated production in 2 counties in California, based on reports by A.S.C. County Committees, included for 1956 and 1957.

4/ A yield of 15.6 (the same as in 1956) and an acreage of 2.2 million acres assumed for 1957.

5/ Grain plus products.

6/ Total grind less exports of semolina and macaroni products, plus estimated use for breakfast cereals.

7/ Residual. Includes statistical errors in items of supply and distribution.

Note: This table replaces the one in the Wheat Situation for February 28, 1957, on page 22.

1/ Years shown refer to years of harvest in the Northern Hemisphere. Harvests of Northern Hemisphere countries are combined with those of the Southern Hemisphere which immediately follow; thus, the crop harvested in the Northern Hemisphere in 1956 is combined with preliminary forecasts for the Southern Hemisphere harvests which began late in 1956 and ended early in 1957. 2/ Figures refer to harvested areas as far as possible. 3/ Yield per acre calculated from acreage and production data shown, except for incomplete periods. 4/ Revised estimates for Northern Hemisphere countries; for Southern Hemisphere, revised preliminary forecasts. 5/ Estimated totals, which in the case of production are rounded to millions, include allowances for any missing data for countries shown and for other producing countries not shown. 6/ Figure for 1935 only. 7/ Comprises Albania, Bulgaria, Czechoslovakia, Eastern Germany, Hungary, Poland and Rumania. 8/ Average of less than 5 years. 9/ Estimates for Syria and Lebanon not shown separately during this period. 10/ Figures for the period shown are not strictly comparable since figures for 1954-56 include allowances for non-reporting areas, which were not included with earlier figures shown, but were included in estimated total for Asia. 11/ Production on European holdings only.

Foreign Agricultural Service. Prepared or estimated on the basis of official statistics of foreign governments, reports of United States Agricultural Attaches abroad, results of office research or other information. Prewar estimates for countries having changed boundaries have been adjusted to conform to present boundaries.

Table 23.- Wheat: Supplies available for export and carryover in the United States, Canada, Argentina and Australia, April 1, 1954-57

Item	1954-55	1955-56	1956-57
	Million bushels	Million bushels	Million bushels
UNITED STATES			
Carryover stocks, July 1	933	1,036	1,033
New crop	984	935	997
Total supplies	1,917	1,971	2,030
Domestic requirements for season ^{1/}	591	600	595
Supplies available for export and carryover	1,326	1,371	1,435
Exports, July 1 through March 31 ^{2/}	209	215	385
Supplies on April 1 for export and carryover	1,117	1,156	3/1,050
CANADA			
Carryover stocks, August 1	602	500	541
New crop	309	494	538
Total supplies	911	994	1,079
Domestic requirements for season ^{1/}	159	144	160
Supplies available for export and carryover	752	850	919
Exports, August 1 through March 31 ^{2/}	173	158	177
Supplies on April 1 for export and carryover	579	692	742
ARGENTINA			
Carryover stocks, December 1	60	83	45
New crop	283	193	262
Total supplies	343	276	307
Domestic requirements for season ^{1/}	129	132	136
Supplies available for export and carryover	214	144	171
Exports, December 1 through March 31 ^{2/}	47	37	28
Supplies on April 1 for export and carryover	167	107	143
AUSTRALIA			
Carryover stocks, December 1	93	91	84
New crop	169	195	130
Total supplies	262	286	214
Domestic requirements for season ^{1/}	72	72	72
Supplies available for export and carryover	190	214	142
Exports, December 1 through March 31 ^{2/}	36	31	47
Supplies on April 1 for export and carryover	154	183	95
TOTALS FOR THE FOUR COUNTRIES			
Carryover stocks, beginning of the season	1,688	1,710	1,703
New crop	1,745	1,817	1,927
Total supplies	3,433	3,527	3,630
Domestic requirements for season ^{1/}	951	948	963
Supplies available for export and carryover	2,482	2,579	2,667
Exports, season through March 31 ^{2/}	465	441	637
Supplies on April 1 for export and carryover	2,017	2,138	2,030

^{1/} Estimated requirements for seed, food (milling for domestic use), and feed for the season.

^{2/} Exports of wheat and flour in grain equivalent; partly estimated.

^{3/} Without imports.
